

Walkthrough

What was audited, what was fixed, what's still broken, and the order to tackle it in.

1. What was audited

Every Swift file in ~/iOS/Nurtura (7 files total: Models.swift, NurturaApp.swift, AuthManager.swift, ConvexAPI.swift, RootView.swift, AuthFlow.swift, OnboardingFlow.swift), Package.swift, and the existing Documentation/nurtura-ios-getting-started.pdf.

2. What was fixed this session

- Package.swift's NurturaShared target and test target were pointed at folders that didn't exist (Sources/NurturaShared, Tests/NurturaSharedTests). Repointed at the real Nurtura/Models, Nurtura/Services, and NurturaTests/ folders, and added .macOS(.v13) to platforms so `swift test` runs directly from Terminal without needing Xcode or an iOS Simulator.
- Added three new test files to NurturaTests/ (previously empty): ModelsTests.swift, AuthManagerTests.swift, ConvexAPITests.swift — roughly 30 test methods covering the Models, AuthManager, and ConvexAPI logic layers.

3. What's still broken

The app itself — not just tests — will not compile yet. Two sets of missing files:

- **Five view types used by RootView.swift don't exist: DashboardView, CareRecipientsView, ScheduleView, MessagesView, SettingsView.**
- **Four manager singletons used by NurturaApp.swift's AppDelegate don't exist: WatchConnectivityManager, HealthKitManager, NotificationManager, PushNotificationManager.**

4. The documentation mismatch

Documentation/nurtura-ios-getting-started.pdf walks through installing Node.js, npm, and Expo, cloning github.com/XtianBDevn/nurtura-ios, and running `npx convex dev` / `npx expo start`. None of that applies to this folder — there's no package.json, no app/ directory, no Expo config anywhere here. That PDF documents a separate Expo/React Native implementation of Nurtura, not this native Swift one. A corrected getting-started guide for this actual codebase has been added alongside it (nurtura-native-getting-started.pdf) rather than deleting the original.

5. Order of operations for tomorrow

- Run `swift test` first — confirms the fixed Package.swift and new test suite actually work on your machine (this couldn't be executed in the sandbox used to write it; SwiftUI isn't available outside Apple platforms).

- Decide the Convex URL question (NT-14) before writing any new network code — wrong backend means wasted work testing against the wrong data.
- Stub the four missing manager classes first (cheap, unblocks compilation) before writing the five missing views (more work, actual UI).
- Once the app compiles, run the existing Testing Checklist from the (now-superseded-for-this-repo) PDF's spirit: launch, sign up, onboarding, all five tabs, dark mode, back navigation.
