

Test Plan & QA Findings

16 checks: the new NurturaShared unit test suite, plus every build-blocking and data-integrity issue found while writing it. NT-11, NT-12, and NT-15 are the ones that actually stop this project from running today.

ID	Area	Check	Priority
NT-01	Build	Package.swift resolves and `swift build` succeeds for the NurturaShared target	Critical
NT-02	Build	`swift test` runs the NurturaSharedTests target with zero compile errors	Critical
NT-03	Unit tests	ModelsTests: all TextSize/SubscriptionTier/UserRole/CareLogType/ScheduleType value checks pass	High
NT-04	Unit tests	ModelsTests: CareRecipient.avatarColorValue fallback-to-sage logic passes for unknown/nil input	Medium
NT-05	Unit tests	ModelsTests: AccessibilitySettings.toggleSeniorMode() on/off round trip passes	Medium
NT-06	Unit tests	ModelsTests: UserProfile decodes from snake_case JSON and round-trips through encode/decode unchanged	Critical
NT-07	Unit tests	AuthManagerTests: AuthError messages match exactly; TokenResponse decodes camelCase JSON	High
NT-08	Unit tests	AuthManagerTests: KeychainManager set/get/delete round trip passes on a real Keychain	High
NT-09	Unit tests	ConvexAPITests: APIError messages match; request bodies encode snake_case keys correctly	High
NT-10	Unit tests	ConvexAPITests: SubscriptionInfo / WatchSyncData / ExportResponse decode from sample payloads	Medium
NT-11	Blocking bug	RootView references DashboardView/CareRecipientsView/ScheduleView/MessagesView/SettingsView — none exist. App will not compile until these are written.	Critical
NT-12	Blocking bug	NurturaApp.swift references WatchConnectivityManager/HealthKitManager/NotificationManager/PushNotificationManager — none exist.	Critical
NT-13	Data risk	AuthManager decodes TokenResponse with a plain JSONDecoder() (no snake_case conversion) while ConvexAPI uses .convertFromSnakeCase for everything else — confirm the auth endpoint truly returns camelCase, or token parsing will silently fail.	High
NT-14	Data risk	AppConstants.convexURL (optimistic-tapir-431) does not match either Convex deployment named in the Expo doc (capable-stork-178 / successful-shrimp-557) — confirm which backend this app should hit.	High
NT-15	Documentation	The existing Documentation/nurtura-ios-getting-started.pdf describes an Expo/React Native/npm project structure that does not exist in this folder at all — following it here will not work.	Critical
NT-16	Manual / not yet automatable	Full app smoke test (launch, sign up, onboarding, all 5 tabs) once NT-11/NT-12 are resolved	Low

Priority key: Critical = blocks the build or corrupts data if wrong. High = a real feature breaks. Medium = degraded but usable. Low = manual, deferred until Critical items are fixed.
